Setup Jenkins in Windows

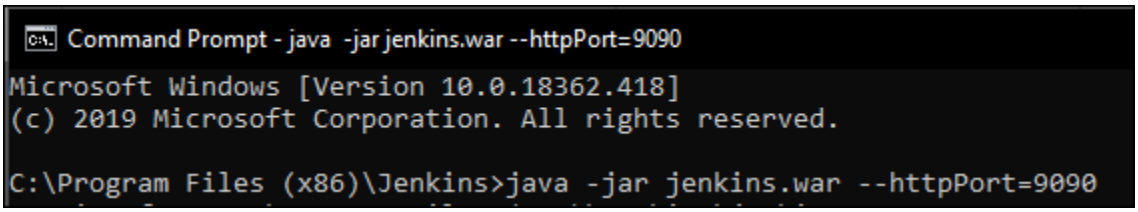

Things to do First:

- Create folder in ‘Jenkins’ folder in drive C:\.
- Create new System Variable named ‘JENKINS_HOME’ and ‘C:\Jenkins’ as value in Environment Variables.

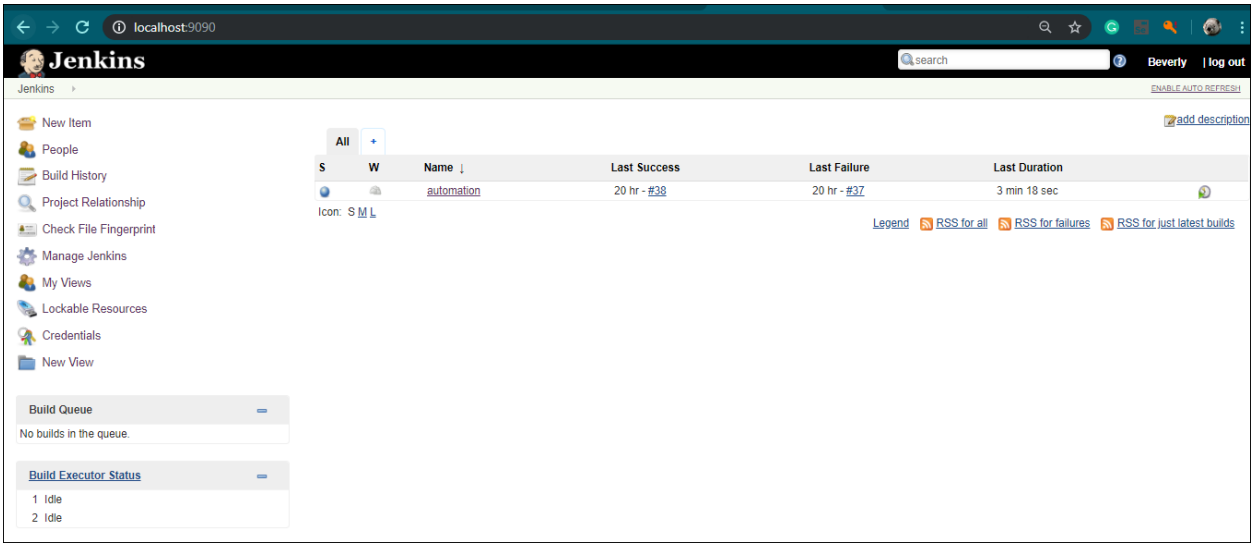

1. Install Jenkins (https://jenkins.io/download/) and Git (https://git-scm.com/download/win)

2. Open cmd, go to Jenkins folder and type 'java -jar jenkins.war --httpPort=9090'.

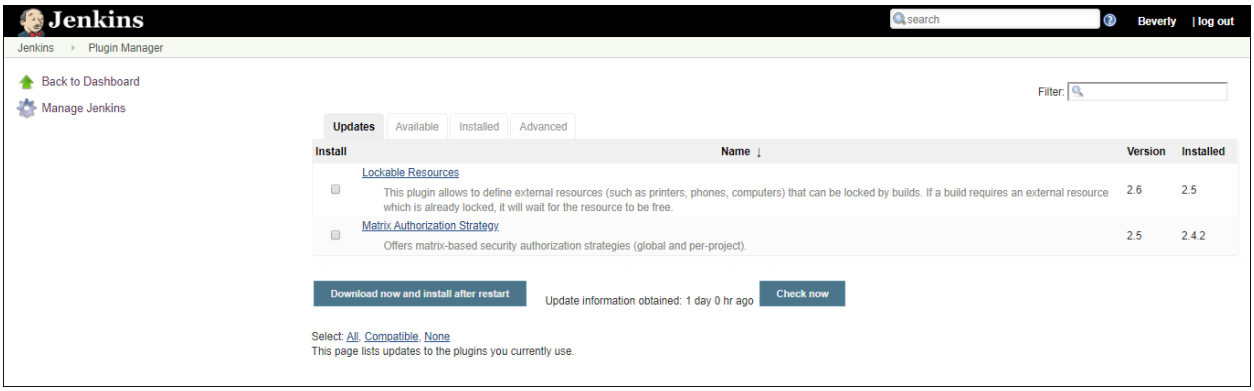

3. Open browser and go to 'localhost:9090'
(Jenkins Dashboard should appear)

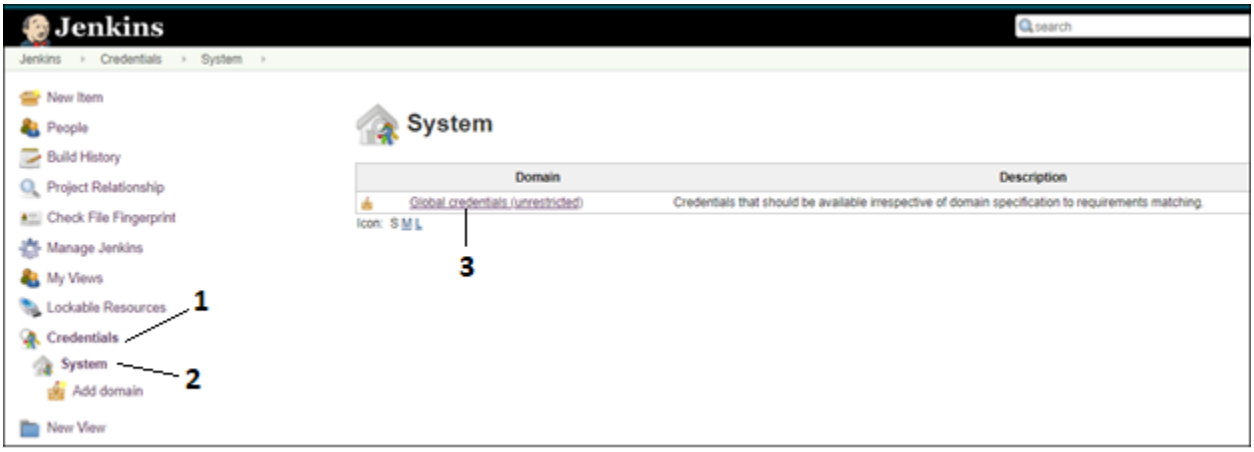

3.1 Setup Jenkins Plugins

* On the Dashboard, go to Manage Jenkins > Manage Plugins
* On Available tab, search and install Git Plugin.
(if Git Plugin is not on the Search Result, check Installed tab if its already installed.)

3.2 Add Credential

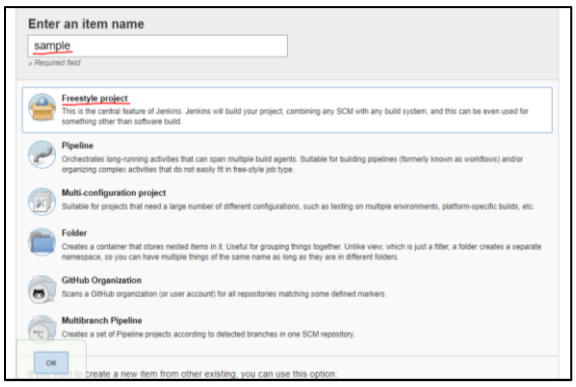

* On the Dashboard, go to Credential > System > Global credentials (unrestricted)

* Click Add Credential:

Set Kind = Username and Password
Scope = Global
Username = beverlysantos
Password = password123

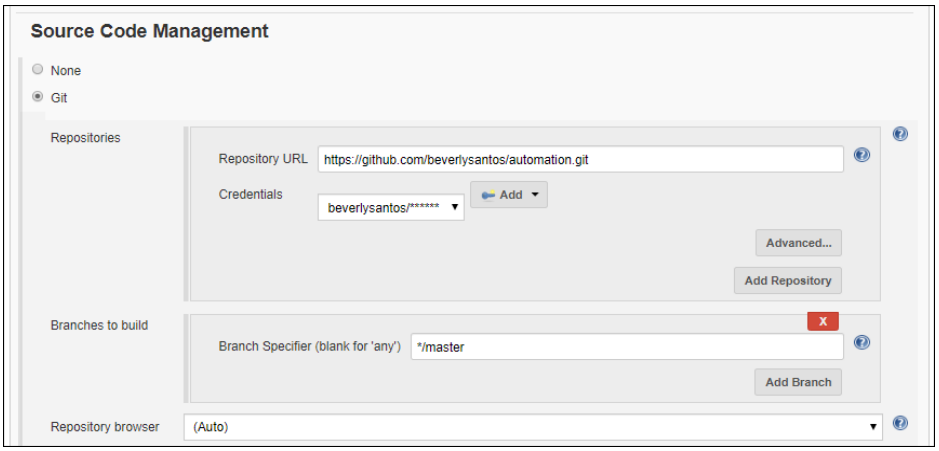

4. Click ‘New Item’. Create a job/item and click 'Free Style' then OK.

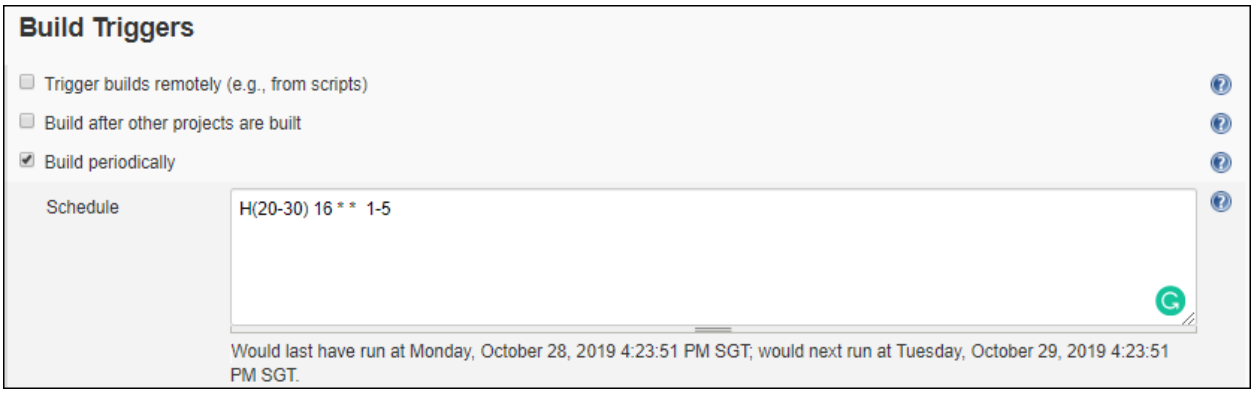

--Configuring job--

5. Under 'General' section click 'Advance' and
check the 'Use Custom Workspace' and use 'C:/Jenkins/job/[[job_name]]' as directory

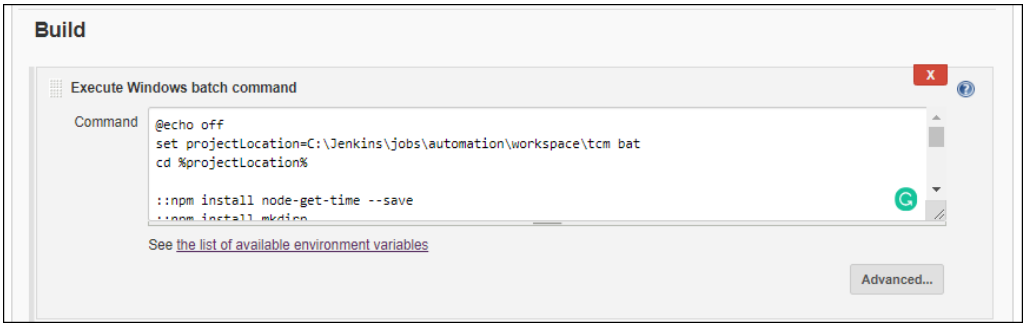

6. Under Source Code Management, select 'Git' and
paste your repository URL. select credential.

(if the automation has its own machine to run the test, set schedule for building the project. On 'Build Triggers' check the 'Build Periodically' and set 'H(20-30) 16 * * 1-5' as schedule. This means that the project will run between 16:20 to 16:30 every Mon-Friday)

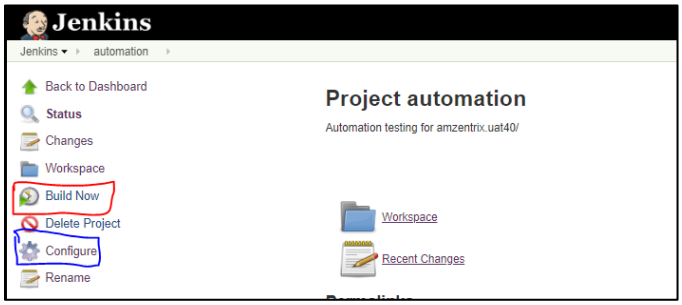

7. Add Build step: Execute Windows batch command
(type 'npm install' for first build)
(for the next builds, clear command and paste what's inside tcm_automation.bat)

8. Apply then Save.

To run the job, click ‘Build Now’. To configure the job, click ‘Configure’.

(note: Workspace folder should contain files from your Github repository)
